Lighting of Railway Premises
- Minimizing obtrusive lighting according to current regulations -

Peter Siemt, DB Station&Service AG, Berlin
Axel Stockmar, LCI Light Consult International, Celle
Germany

5400 small, medium or large passenger railway stations
with
900 station buildings, 9600 platforms, 2000 underpasses,
3450 platform roofs, and 8500 weather houses
~ 1.000.000 luminaires

- Stations are located in all different environmental zones classified as E1 to E4 in CIE 150:2003, i.e. in natural, rural, suburban, and urban surroundings
- Depending on illuminance levels required for safety and comfort for passengers and personal, and on reflection properties of platforms surfaces, some light will be spread into the surrounding environment
- This spill light should be minimized by adequate measures

EN 12464-2:2014, Otrusive Light (I), Definitions

- Guidance for the assessment of obtrusive light is given in publication CIE 150-2003 “Guide on the Limitation of the Effects of Obtrusive Light from Outdoor Lighting Installations”.

- **Obtrusive Light**: Light, outside the area to be lit, which, because of quantitative, directional or spectral attributes in a given context, gives rise to annoyance, discomfort, distraction or a reduction in the ability to see essential information.

- **Curfew**: The time after which stricter requirements (for the control of obtrusive light) will apply; often a condition of use of lighting applied by a government controlling authority, e.g. the local government.

- The different limits given are differentiated according to the environmental zones (E1 to E4). The differentiation takes account of the ambient brightness of the environment to be experienced.

EN 12464-2:2014, Maximum Values of Threshold Increment from non-road Lighting Installations

<table>
<thead>
<tr>
<th>Road classification</th>
<th>M2/M1</th>
<th>M4/M3</th>
<th>M5</th>
<th>No road lighting</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Threshold increment (TI)</strong></td>
<td>15% based on adaptation luminance of 0,1 cd/m²</td>
<td>15% based on adaptation luminance of 1,0 cd/m²</td>
<td>15% based on adaptation luminance of 2,0 cd/m²</td>
<td>15% based on adaptation luminance of 5,0 cd/m²</td>
</tr>
</tbody>
</table>

For users of transport systems for the relevant viewing positions in the path of travel the threshold increment shall not exceed 15 % based on the actual adaptation level.

If the adaptation level is not known and no road lighting is provided, an adaptation luminance of 0,1 cd/m² shall be applied.
Evaluation of Glare experienced by Train Driver (DB Guidelines 813.0502)

- The disability glare experienced by a train driver when approaching an open or covered station shall be evaluated using the **threshold increment** method.

- The **standard observer position** for a straight horizontal section of a platform is given with an eye height of 2,20 m above the platform surface, and 1,66 m sidewise the platform edge with a viewing direction parallel the platform (track) 1° below the horizontal, and at such a distance in front of the first luminaire so that the first luminaire is seen at 20° above the horizontal.

- Under the assumption that the adaptation luminance is equivalent to 1/10 of the average luminance of the platform surface, the **threshold increment shall not exceed 15 %**.

Minimizing Obtrusive Light (I)

- **Roof mounted** (fluorescent) luminaires for direct illumination in horizontal (recessed) position along platform edge do not cause glare problems for passengers, personal, and train drivers if the glare rating limits given in EN 12464-2 are fulfilled

- There is no light emission for angles of elevation greater or equal 90°, the **upward light ratio (ULR)** is zero

- **Pole mounted** luminaires for direct illumination in standard arrangements (mounting height 6 m, luminaire spacing 20 m) need to have restricted luminous intensities at angles of elevation greater or equal 70° to fulfil the glare restrictions (train drivers)

- There is no light emission for angles of elevation greater or equal 90°, the **upward light ratio (ULR)** is zero

- **High pole lighting** using floodlights not recommended at all
Minimizing Obtrusive Light (II)

- Adjustment of illumination levels according to number of passengers as specified in revised EN 12464-2:2014, lower levels create less spill light

- Reduction of average illuminance during night time; e.g. between 11 pm and 5 am one step down, but not less than 5 lx

- Switching off platform lighting during hours of guaranteed non-operation of trains in natural/rural surroundings

- Reduction of luminaire mounting height (e.g. from standard 6 m down to 4 m mounting height) in natural surroundings

- Additional shielding of luminaires to minimize the size of the illuminated area outside the platform in natural surroundings

Minimizing Obtrusive Light (III)

- Use of high efficacy light sources and of high efficiency luminaires with suitable luminous intensity distributions installed in appropriate positions to provide adequate platform utilances/utilisation factors (not much light onto the tracks)

- Installation efficiency is evaluated using platform utilances or platform utilization factors

- The Utilization Factor Platform is defined as the ratio of the total flux received by the reference area of a platform to the total light source flux of the installation

- Depending on the average lighting level required there are limits for the power densities (in W/m²) specified which should not be exceeded
Minimizing Obtrusive Light (IV)

- Use of luminaires with luminous intensity distributions with reduced backlight (C_{270}^\text{plane}) to limit light on properties / facades, e.g. alongside freight track areas, and to limit the disability glare for users of nearby transport systems (road, railway, waterway).

- Reduction of light levels on roads leading to stations or to freight track areas as well as on parking lots dependent on traffic volume (adaptive lighting according to revised European Standards EN 12464-2:2014 and EN 13201-2:2015 'Road lighting').

-----

- For the pre-selection of suitable luminaires 'tables platform lighting' and 'tables railway area lighting' have been developed which allow to consider the impact on the environment at an early design stage.

Platform Lighting Table for Pre-Selection of Suitable Luminaires

- LED based 2x150W in line, 2x150W in line (200 W/m² for 2 x 360 W)
- Table of luminaire type
- Table of luminaire type
- Maintenance factor M 0.8

CEN Flux Code 41 79 99 100 100 (EN 13032-2)
Conclusions

- Use of luminaires for direct illumination at relatively low mounting heights with appropriate luminous intensity distributions in energy efficient installations (high utilization factors) does not cause problems in terms of vertical illuminances on buildings/facades, of luminous intensities in potentially obtrusive directions (glare), and of the proportion of luminous flux emitted above the horizontal

- The describes measures play an important role in the Deutsche Bahn AG approach to minimize light pollution, obtrusive light, and sky glow
Lighting of Railway Premises
- Minimizing obtrusive lighting according to current regulations -

Thank you very much for your attention!
